

# SOLAR OPTIMUM OFFERS

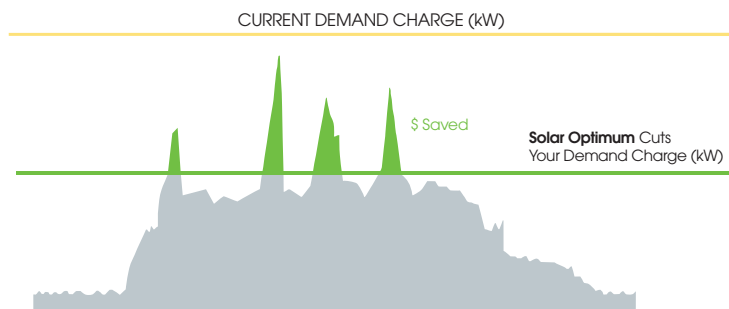

## Peak Shaving Energy Systems for Commercial and Industrial Customers

For many businesses, their bottom line is greatly affected by peak demand charges that can make up 50% or more of their monthly electricity bill. And now, there is a solution.

When it comes to **Energy Peace of Mind** and energy storage solutions, look no further than **Solar Optimum**. Our team of experts can help you develop a system that will reduce demand charges by utilizing state-of-the-art intelligent energy storage systems to instantaneously shave the peaks the utility normally bills you (called demand charges). Our energy storage solutions are comprised of state-of-the-art energy storage technology from the most trusted brands in the energy industry. As an energy storage specialty contractor we are technology agnostic and will help you evaluate which vendor is best for your application.

Every month your business receives a utility bill which is made up of two parts: 1) **Demand charges** and 2) **Energy charges**. Specifically, your demand charge is the highest spike of electricity that your business consumes during a 15 minute usage period each month.

As demand charges for your building begins to spike, Solar Optimum's Energy Storage system will intelligently dispatch power to discharge the battery instantaneously and offset the spike.

When you combine battery storage with a **solar PV system**, your business will **save on both energy and demand charges**—reducing your total energy costs by as much as 80% for the life of the system, and creating a long term hedge against increasing utility costs.

Who says you cant have it all?

Contact our experts and allow us to develop a future proof energy plan for your business.
